

Process

The SunSHIFT™ process of working with clients is as straightforward and as modular as the system itself.

1

Client questionnaire

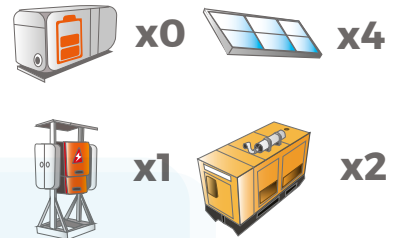

- A two page questionnaire including geographical information, diesel fleet and electrical load data and diesel fuel costs is completed.

2

Optimal selection of modules

- SunSHIFT uses the leading specialist software to rapidly determine the optimal configuration for the client.

3

Execution of the commercial agreement

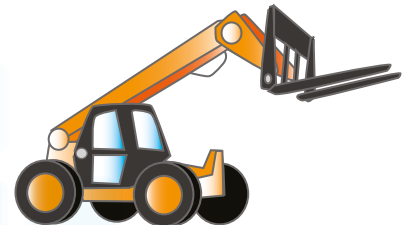

- The client's preferred model is discussed and is likely to range from a purely ongoing service (e.g. purchasing the electricity produced each month) to a purely upfront service (e.g. purchasing the plant upfront). The contract covering the upfront and the ongoing services is agreed. An Installation Operational Manual (IOM) is provided.

4

Transport, minimal pre-works and on-site assembly

- SunSHIFT transports the modules via containers from off-site storage to the site where SunSHIFT safely and rapidly assembles and commissions them.

5

Additional services

- SunSHIFT offers remote monitoring via a web-based dashboard, operation & maintenance and relocation services.
